

TESTING

Testing is a crucial phase to ensure the platform functions smoothly and meets user expectations. We performed different types of testing to identify and fix issues at every stage of development.

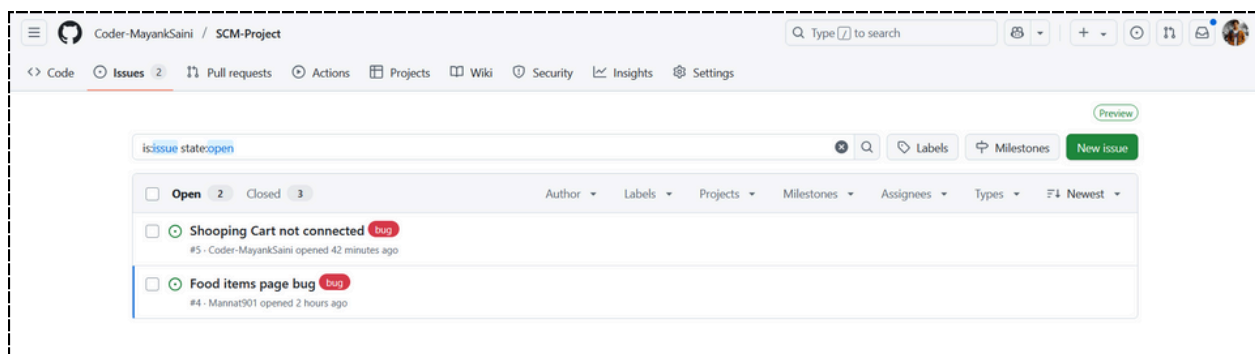

Types of Testing Performed:

Unit Testing:

Tested individual components like forms, buttons, and input fields to ensure they worked as expected.

Integration Testing:

Checked the interaction between different pages, such as the product page linking correctly to the product detail page and the checkout process flowing smoothly.

User Testing:

Gathered feedback from hostellers by giving them access to the platform and observing their experience. Collected feedback to make improvements in navigation, UI design, and overall user journey.

Issue Tracking:

Logged issues and bugs in GitHub Issues to keep track of problems.

Resolved reported issues before moving forward, ensuring a clean and stable codebase.
